Zeppelin Systems, the world leading plant manufacturer for high quality bulk material handling, has remarkably grown over the past 60 years. We cover the demands of a wide range of industries and supply all plant manufacturing services from one single source, whether basic engineering, in-house production of components, final assembly or comprehensive customer service. Thanks to our financial strength and our global network, we have long been a reliable partner for our customers.

Every Zeppelin plant is developed according to the clients’ specific requirements, and realized, thanks to our customized innovative processes and technologies.

The knowledge we have acquired over more than 60 years of plant manufacturing and the world’s largest network for bulk material handling is the key to providing ideal solutions, whatever the challenge; after all, your success is our goal.

Zeppelin plant engineering – business fields

- **Polyolefin Plants**
  - Plants for plastics producers and forwarders
- **Plastics & Rubber Plants**
  - Plants for the plastics processors and rubber industry
- **Food Processing Plants**
  - Plants for the food, confectionery and baking industry
- **Mixing Technology**
  - HENSCHEL-Mixers®, mixing systems
- **Silos**
  - Storage silos, mixing silos, process silos
- **Components**
  - Rotary feeders, diverter valves, discharge and dosing units, sifters, filters …
- **Service**
  - Spare parts, customer service and consulting
- **Modernization/Revamping**
  - Optimization of production lines and plant controls
WE ARE PASSIONATE ABOUT FOOD

No other company has so much experience in the construction of modern food technology systems.

As a globally active company, we serve the key markets worldwide, know the various technical requirements, as well as regulations, and adapt these to our engineering concept.

Our team of specialists will gladly provide you with engineering advice as early as the plant design stage. Processes can be optimized in advance through computer simulations and even undergo practical testing with a number of comprehensive trials in our technology center. In doing so, we achieve high investment security for your project.

Our clients appreciate our extensive know-how in all aspects of raw material handling. We master the process steps and technology from raw material receiving to its processing, and develop integrated solutions designed to fit perfectly into the system — from one single source. Our scope naturally includes optimal control technology and professional customer service around the world.

The whole range of solutions – from one single source

Receiving, storage, discharge, transport, treatment, dosing, mixing and control of raw material: we develop extraordinary solutions in all areas; this is why we are also the ideal partner for revamping, plant retrofit and modernization. All key components are from our own development and production and many are patented, which allows us to ensure reliable spare parts delivery for years to come. The excellent quality equipment is designed for continuous operation around the clock. It meets the industry’s strict hygiene standards and is designed to be easy to clean.

Storage
- Silo technology, containers
- Big-bag handling
- Filter technology
- Bags

Discharge
- Vibratory cones and bottoms
- Fluidizing bed systems
- Discharge and blow-through rotary feeders
- Dosing and conveying screws
- Discharge and dosing units KOKESL KA/KAD
- Multi-screw discharge system SPA5

Transport
- Secondary air conveying (pressure, suction)
- Plug conveying
- Dilute phase conveying
- Conveying screws

Processing
- Sifting
- Fermenting
- Temperature control
- Conditioning
- Recrystallization
- Dissolving

Dosing
- Bulk materials
- Liquids

Mixing and kneading
- Mixers
- System solutions

Cleaning
- Design
- Processes

Control
- Process automation
- Process management system
- Batch tracking
- Recipe dosing control
- Scale value digitizer
- Measuring and evaluation units
- Control cabinet construction
Would you like to know how the chocolate flakes will react when mixed into your new recipe, which type of conveying results in the lowest abrasion with one of your raw materials, or how your agglomerates can remain intact? Take advantage of our technology center.

We provide you with all necessary testing facilities for dosing, conveying, weighing, sifting and mixing of your recipe. Our operating staff and development engineers are there to assist and advise you. We can then evaluate your tests in the adjoining laboratory and analyze and discuss the results with you in our modern meeting rooms equipped with the latest office technology.

If desired, you can also rent our technology center and, following some instructions, carry out the tests yourself.

We carry out dough processing tests together with the Institut für Getreideverarbeitung GmbH (IGV – institute for grain processing) near Potsdam with our lab-size mixing and kneading system Codos® for throughputs of up to 250 kg/h. There, we can produce and bake dough with your raw materials according to your recipe in order to analyze its texture and taste.

Our clients invest a lot of money in their plant, so they want to be sure that everything will function exactly as they imagined. In order to provide them with the necessary investment security right from the start, we invest a lot of money in technology.

Computer simulation ensures, among other things, the efficiency of production processes and optimal dimensioning. Several hours or days of production may be observed in real time or time lapse to identify possible blockages and bottlenecks, and reveal simplification potentials.

By optimizing the results, investment costs can be reduced. Our simulation software – developed in cooperation with a renowned university – has already convinced many of our clients.

We can also translate this theory into practice in our Food Technology Center.

Our simulation software – developed in cooperation with a renowned university – has already convinced many of our clients.

We can also translate this theory into practice in our Food Technology Center.

FROM THEORY TO PRACTICE

Continuous sliced bread production
24-HOUR PRODUCTION
with constant product quality through automatic raw material handling

Blower station
Wheat flour silo
Sugar silo
Salt silo
Rye silo
In-line sifter
Storage and weighing of ingredients
Salt dissolving system
Oil tank
Yeast plant
Mixing tower for sourdough production
Fermentation tank
Storage tank (sourdough)
Sourdough starter vessel
Cleaning unit
Malt plant
Residual bread processor

Example of plant
Production of baked goods
Zeppelin relies on the “first in – first out” principle to ensure particularly gentle handling of liquid and powdered raw materials. We develop individual storage solutions depending on the product properties, as they may require cooling, insulation, blanketing with dried air, discharge devices to avoid the forming of lumps and explosion protection according to ATEX directive.

Our silos and storage tanks are designed to ensure optimum conditions for cleaning, oxidation-free storage and appropriate temperature regulation.

We are ready for everything
Our systems can be prepared for any kind of raw material delivery:
- In containers or tanks, as a standard or special version with heating, insulation, agitator, etc.
- In bags with or without inner liner
- In plastic big-bags with or without inner liner, as disposable or dual-use containers
- In tanker trucks with gravimetric, pneumatic or pump emptying

Welcome to the jet set
The fully automatic jet venting filter continuously filters the conveyed air from pneumatically loaded containers and silos in continuous operation and distinguishes itself through a high degree of filtration with constant filter resistance.

The compressed air unit is designed to be absolutely hygienic. All parts coming into contact with the product are certified according to Regulation (EU) 1935/2004 or Regulation (EU) 10/2011. For maintenance, cartridges are removed from the raw gas side (product area).

Sifting is a quality feature
The vibration sifting machine is used as a protective or control sieve between the tanker truck and the silo.
Zeppelin has developed several components for the application of hard to handle bulk material.

Vibratory bottoms, cones and fluidizing bed systems

Vibratory bottoms and cones, as well as fluidizing bed systems, ease product conveying to the outlet. In order to activate the product flow and the conveying of hard to handle bulk material, an eccentric motor is used with the vibratory bottoms to create horizontal, circular vibrations, which are transmitted to the product column. The product outlet is directly connected to the subsequent dosing or conveying device, resulting in a closed system.

Fluidizing beds are suitable for all fluidizable materials for discharge from silos and containers. In the process, the air is directed through a semi-permeable fluidizing bed and the materials to be conveyed are fluidized.

Rotary feeders

Rotary feeders serve to dose and discharge bulk materials below silos and containers. The feeders are suitable for all kinds of powdered and granular products. Difficult media can also be handled easily.

Discharge and dosing units KOKEISL KA/KAD

The secure discharge of bulk material with problematic flow properties is possible with the discharge and dosing unit, even with varying throughput quantities. Discharge can be seamlessly controlled with an infinitely variable valve. The units are easy to clean; all surfaces in contact with product are of stainless steel. Thanks to in-house developed self-optimizing controls, very accurate dosing into a system can be realized with a capacity of more than 30 t/h.

Multi-screw discharge system SPAS

Space saving, cost effective, and faster than previous systems, the multi-screw discharge system efficiently discharges from the silo to pneumatic vacuum transfer system. This compact device has up to five conveying screws that are extremely versatile and, for example, can be used to operate five conveying lines. This compact system is easy to access and provides considerable advantages in regards to cleaning and maintenance.
Product-specific conveying is of decisive importance for an optimal final result. We have various conveying systems for the transport of abrasive or fragile bulk material, such as granulated sugar, cappuccino powder and infant milk formula.

We always use the most suitable conveying process, techniques such as dilute phase conveying in excess pressure and low pressure operation, extending to pneumatics overlaid with shielding gas. An especially gentle method of conveying is secondary air conveying. Here the conveying speed is extremely reduced. The product forms plugs which are repeatedly loosened by additional air and are regularly pushed through the line.

We convey liquid raw material with the most varied pump systems, such as centrifugal, eccentric rotor or piston dosing pumps.
Temperature control, drying and moistening, homogenization, sifting, mixing, grinding or recrystallization: there are many possibilities for preparing raw material. Our system solutions cover the full range.

**The important thing is what you make from them**

**Continuous production of chocolate cookies**

Heating – drying – cooling

Consistent product quality depends to a great extent on the temperature of the complete product and of the corresponding individual raw materials. With the PneumoTherm fluidizing bed heat exchanger it is possible, for example, to cool or heat flour to the required temperature. PneumoTherm is also used for drying liquefiable products.

Sifting is a must

The rotation sifter is used as a preliminary sieve in front of silos or in dumping stations and serves as a final sieve underneath containers or is available as an inline sifting machine for pressure-tight operation in pneumatic conveying lines.

**Coarse materials can be easily removed; the sifter drum of polyester or stainless steel is exchangeable. Our rotary sieves serve to sift out foreign matters and impurities, as well as protect the downstream processing machinery. The frame, containers and all parts coming into contact with the product are manufactured hygienically from stainless steel 1.4301.**

Sugar grinding and recrystallization

We have developed a system concept for sugar grinding that is adapted to the different requirements for variously fine grinds. Conditioning is possible during processing. Recrystallization is controlled with our know-how and the powdered sugar is provided at the desired temperature and can be stored, lump-free, without additional treatment or anti-caking agents.
The handling of liquids requires profound knowledge of the properties of viscous and compressible media. The dissolving or suspension of raw materials such as sugar, salt and yeast, the melting of fat or the temperature-controlled storage of low viscosity products such as malt, glucose and glycerin are no problem for us.

The storage tanks are double-wall insulated depending on the requirements, are equipped with stainless steel agitators or a cooling function, and work extremely gently. Like with all storage tanks, we pay particular attention to optimal cleaning possibilities and suitable temperature control.

Biotechnology for better quality

For the continuous liquid sponge production, water, wheat flour and yeast suspension are gravimetrically dosed into the continuous mixer and immediately mixed together. The process for manufacturing wheat liquid sponge can also be carried out in batches. The dough mass is then placed in the fermentation tank and is pumped into the storage tank upon completion of fermentation. The dough is cooled in transit in order to stop the fermentation process.

Sourdough can be produced with our systems either in batch operation or continuously. In both cases you can be sure of receiving an impeccably hygienic product at a consistently high level of quality.

Cracked or whole grains are used for the manufacture of hot soaked grains. The starting materials are coarse grain, whole meal grain, spelt or rice. The grains are steeped in hot water (80°C), heated to 90°C, and then cooled down to 35°C. 10%-30% of hot soaked grains are integrated into the end product. The end product develops a more aromatic flavor and is moister due to the water proportion.

Soaked grains consist of raw materials such as coarse grain, cereals, bran, linseed, sunflower seeds, pumpkin seeds, millet or sesame. The grains are soaked with water and possibly with syrup additives and used in a recipe in proportions of 20%-30%.
When precision is important, we are in our element. From components for batch weighing to differential dosing scales, including control system, you receive everything from one single source.

For any eventuality
Depending on the requirements, we have various possibilities for efficiently storing and dispensing free-flowing and hard-to-handle substances, from the manual, semi and fully automatic minor ingredients system MicDos, to the medium ingredients system MinDos to the fully automatic, high performance system MacDos.

Dosing liquids
We also offer a selection of suitable methods for dosing liquids and temperature-controlled masses, such as volumetric and gravimetric dosing systems.

Dosing bulk material
Dosing and conveying screws with direct drive are available for the dosing of bulk material and the precise filling of scales. These also fulfill strict hygiene requirements.

KOKEISL rather than screw
The KOKEISL technology offers several advantages compared to a conventional dosing screw. The KAD component does not require an additional end cap to prevent trickling at the end of a dosage procedure. The product is gently discharged by the curved agitator, preventing damage to sensitive products such as chocolate chips or chunks during dosing. There is considerably less space required for the same performance, as well as an overall enormous savings potential due to the omission of costs for assembly and control technology.
We naturally occupy a pioneering role in mixing technology. We mix everything, from powder to dough.
CONTINUOUS MIXING AND KNEADING
WITH THE CODOS® SYSTEM

Examples of applications

Fresh baked goods
- Bread, rolls & baguettes
- Hamburger buns
- Sliced bread
- Croissants
- and many more

Extended shelf-life baked goods
- Cookies
- Crackers
- Salty snacks
- and many more

Confectionery
- Chocolate cream
- Sugar masses
- Cereal bars
- and many more

16,000 pretzels per hour, 2 million rolls daily, 275,000 cookies per hour: the Codos® system is designed for large jobs.

The continuous mixing and kneading system provides consistent dough quality around the clock. This means that the same optimal results are achieved at all times. The Codos® system comprises the complete dry material and liquid dosing, as well as the mixer and kneader. Perfectly designed controls complete the system.

The benefits in comparison to batch kneaders are convincing:
- Continuous optimal product quality
- Constant dough temperature
- Energy savings of up to approx. 30%
- Increased line efficiency
- Fully automatic operation
- Simple operation

Throughput: 500 – 8,000 kg dough/h
Zeppelin has developed an innovative system to eliminate cross-contamination of raw materials.

Instead of classic pipe lines, with ReciPure® we use mobile containers assigned to the recipes. The batch containers are transported on automatically guided transport vehicles or on rail systems with integrated weighing beneath the storage container.

When all required recipe ingredients have been collected, the containers are transported to the mixers or kneaders. The agile, computer-controlled transport systems also enable the simultaneous collection of different recipes.

The advantages are obvious:
- No cross-contamination
- Consistent product quality
- Secure batch tracing
- Automatic control over the entire process
- Easy cleaning without production interruption
- Parallel production of different recipes
- Fast recipe change possible
- Flexible conversion for seasonal products

Applications for a contamination-free production
- Fresh and long-life bakery products
- Mixtures, e.g. baby food, baking mixes, spices, soups, sauces
- Confectionery
- Applications other than food industry: e.g. plastics, compounding and pharmaceutical industries
Our Cleaning In Place (CIP) solutions contribute to efficient cleaning of modern production plants. The cleaning agents circulate through the production cycle without the need to dismantle the piping or the tank systems. Cleaning results are always the same thanks to a recipe-controlled and automatic cleaning process. Hygiene can therefore be ensured, even for sensitive process areas, such as liquid yeast, wheat sponge or liquid egg, and a high level of food safety is maintained.

In addition to developing intelligent cleaning systems, we give thought to every system component we develop in order to ensure a simple, yet thorough, cleaning takes place, including the easy dismantling of parts, easy access, and even the use of stainless steel for screws, etc. With our intelligent designs we try to minimize impurities by, for example, avoiding dead spaces or by developing systems with residue-free discharge.
EVERTHING UNDER CONTROL

Modern control system technology helps avoid errors, guarantee consistent quality, ensure product safety, more effectively control materials management and optimally plan the production process. Software developments in keeping with your requirements are our strength.

IT’S ALL POSSIBLE: BATCH AND CONTINUOUS OPERATION

Process management system

You maintain absolute control with our process management system PrismaWEB®. Each change to the recipe is protocolled. All supplied batches and incoming raw materials can be traced. This makes a quick reaction possible when required.

Logistics and warehouse management functions are available, and connections to various ERP systems are possible.

All incidents, production data, batch protocols, etc. are archived and can be reviewed at any time. User management regulates the access of authorized persons for defined functions. Unauthorized persons will not be able to make any changes.

Dosing control

We cover the process control level with recipe dosing controls and compact water mixing and dosing units, which are suitable for batch and continuous operation.

At the production level, our scale value digitizer and compact measurement and evaluation units for measuring and regulating conveyor apparatus are used, among others.

Recipe dosing control

The user-friendly recipe dosing control systems MINC 8000 and MINT 99 were specially developed for small and medium-sized operations. They serve the purpose of weighing and administering dry and liquid ingredients in strict accordance with the recipe.
